

VENTENATA AND MEDUSAHEAD WORKSHOP

10 YEAR ANNIVERSARY

Join us to learn identification, the latest science, management strategies, and more. Ventenata and medusahead are highly invasive annual grasses that threaten rangelands by reducing forage, degrading wildlife habitat, and increasing wildfire risk. For the past 10 years, landowners, agencies, and researchers have worked to combat these species across Wyoming. Together, partners have surveyed and treated over 400,000 acres, invested nearly \$30 million in management, and advanced research and monitoring to improve long-term rangeland health.

WEDNESDAY AUGUST 12TH

9:00a.m. - 2:00p.m.

**Sheridan Research and
Extension Center (Watt
Building)**

1090 Dome Loop, Sheridan, WY 82801

Lunch Provided

Classroom and Field Sections

RSVP BY AUGUST 5TH
